

Work Assistant

Local-first workspace for recovering Code Agent context

AMD AI DevMaster Hackathon 2026 | Track 2: Private AI Agents

MODEL SERVING

Qwen3-14B

AMD Radeon Cloud | ROCm + vLLM

THE PROBLEM

Development context becomes fragmented across Git, file changes, terminals, and AI conversations. After an interruption, developers cannot tell **where a task came from or what to do next**.

THE SOLUTION

Work Assistant unifies local histories, work items, and evidence so developers can recover context quickly and trace each task to its source conversation.

Core capabilities

- **Evidence-based assessment:** scans Git and local file changes before producing plans, progress conclusions, risks, and next actions.
- **Incremental RAG:** processes only new or changed conversation segments, then retrieves relevant local context with hierarchical summaries.
- **Traceable work items:** preserves source conversations and exports continuation prompts for Codex, Claude Code, Gemini, Kimi, and more.
- **Local conversation workspace:** filters, analyzes, and summarizes long Code Agent histories by provider and project.

1. Evidence-based Task Analysis

Local evidence is inspected first; the LLM produces conclusions grounded in the actual project state.

2. Incremental RAG and Traceability

Only updated conversation segments are processed, summarized, and linked back to their source.
